

ON-PREM / CLOUD INTEGRATION:

Access and exchange data between on premise and the cloud – with support and connectivity for loading large and diverse data types.

OTHER INTEGRATION:

SAP HANA platform, HPE Vertica, MongoDB, Apache Spark on Apache Hive, SAP IQ software, Apache Cassandra, Teradata, SAP S/4HANA®, Greenplum Database, SAP Vora, MS Analytics Platform System, Apache Spark

Hadoop: MapR, Cloudera, SAP Cloud Platform Big Data Services

Hadoop distributed file system data storage formats including CSV, Avro, Parquet, and ORC

Spatial data including loading, geocoding, and matching

Unstructured text from PDF, Microsoft Word, Web log, Microsoft Outlook, Microsoft Excel

File transfer protocol (FTP), secure file transfer protocol (SFTP), pretty good privacy (PGP), and single sign-on (v)

DATA MANAGEMENT SUITE

FAQ

What is the Data Management Suite?

The Data Management Suite helps access, transform, and connect your data, letting you deliver reliable and timely information to all business units. It offers the best tools for data integration, quality and cleansing capabilities so your decision makers can rely on trusted data.

The amount of data we have is growing. It's hard to manage, much less understand. Can this tool help our organization?

Yes, this suite of tools supports a large volume and variety data including structured, text, Big Data, device, social, machine and more. With it, you can support both operational and analytical data-driven initiatives regardless of your data source. When data is ready for analysis, business users can extract relevant information.

Can I use this solution to see a view of all data across the enterprise – even if it's not SAP?

Yes, CATCH Intelligence can help you create a complete view of information by accessing data – of any size and from any data source. It even provides the ability to process structured and unstructured content from a variety of data sources across your enterprise. You can extract, transform, and load any data source into any target source to create a complete view.

Data quality is an issue in my organization, will the Suite help?

Yes, the Data Management Suite allows you to improve data quality by correcting data issues as they arise and preventing quality issues before they occur. It allows you to standardize, correct, and match data to reduce duplicate information and identify relationships.

The common saying with data is garbage in/garbage out. How can I ensure that my data is good quality before moving it?

The Data Management Suite empowers you to improve, enhance and consolidate data. Ultimate flexibility allows you to correct data from any source, domain, or type; validate data; fill gaps within existing data; match and consolidate data with data duplication checks; and perform data quality checks before analyzing, moving, or integrating data.

What is the fastest way to optimize this solution?

CATCH Intelligence provides the services and experts needed to support you at every stage of the data management lifecycle. We can help you understand the best practices to improve data quality in all areas such as completeness, uniqueness, consistency, and timeliness.

Is there a proven way to get a data migration project started?

The best way to jump-start data migration projects is with a Strategic Planning session. We'll assess your existing IT landscape to understand exactly what data your company has, where the data is located, and how its quality can affect the business. We'll partner with all areas of the business to address quality and governance issues head-on, then deliver a customized and proven implementation plan to help you meet your needs within your timeline.

How can I ensure long-term success with data quality?

As part of working with CATCH Intelligence on your data migration project, our experts will coach, mentor and train your personnel along the way. We'll address the important aspects of change management and communication management as part of our overall project management discipline.
