

# CMS Enhanced Auditing: It's All About Simplicity

---

CMS Enhanced Auditing is a tool that facilitates export of data from the CMS (Central Management Server) system database, and then allows for reporting of the information to administrators and others who also need the information. Extract the contents of the installation package into a convenient location on your BusinessObjects server.

## Delivering Value

With CMS Enhanced Auditing, you have valuable information readily available to answer questions about how your BusinessObjects environment is being used and then make improvements in areas — such as unused reports, long running reports, folder security, etc. — that need additional focus. Provides additional details above standard auditing alone (additional functionality that BusinessObjects doesn't offer out of the box) so that Administrators can better manage

## BusinessObjects system & licenses:

- Who's using BusinessObjects
- How many reports
- What accounts have never been used
- What reports are being used and which ones are not
- Upgrade clean up

## Compliance

- HIPAA
- SOX
- Security/Audit
- Can monitor sizing, concurrency and see peak periods, so that decisions can be made to ease peak periods

---

## Universe Metadata

- See the objects contained in all universes, as well as their associated database fields.
- Be able to report on both UNX and UNV universes.
- Assess what reports and universes will be impacted if the database or universe are edited.

## Report Metadata

- Review what data fields are contained in your reports.
- Ability to report on Crystal, Crystal Enterprise, as well as Web Intelligence reports.
- Web Intelligence reports will provide more data source details including:
  - Query the last run durations.
  - Identify longer duration reports.
  - Identify reports that return less than the full query results.
  - Identify reports with higher complexity by looking at the flow count.
- List data source types.
- Gain insight into provider settings for FHSQL and Text file data sources.
- Ascertain report dependencies for data fields, universes, universe objects, and universe data fields.
- The ability to select which metadata item to process.

## Error Analysis

- Proactively discover problems with reports and universes that cannot connect to their data sources.

## Additional Features

In addition to the features listed above, you will also have the ability to gather more information about Publications including:

- Dynamic recipient report documents.
- Discover errors with publications before a scheduled instance fails to run.
- Ascertain the type of Publication (Enterprise or Dynamic)
- Enterprise recipient counts.
- Excluded enterprise recipient counts.
- Destination schedules and the destination email recipients.
- Scheduled instances.
- Scheduled instance statuses.
